What are sound Mounds?

Sound Mounds are a visual for students to recognize the placement of phonemes that they hear within specific words. The sound mound allows students to see the frequency of a specific sound, and where that sound is typically located.

For example, the long a sound is represented under the sound mound. We typically see the open syllable a at the beginning of a word or at the end of a syllable. The silent e with the a is seen at the beginning of a word, and the ai pattern is typically seen in the middle of a word. The ay pattern of the long a is typically seen at the end of a word.

***Note*:** This is where these patterns are typically located within word.

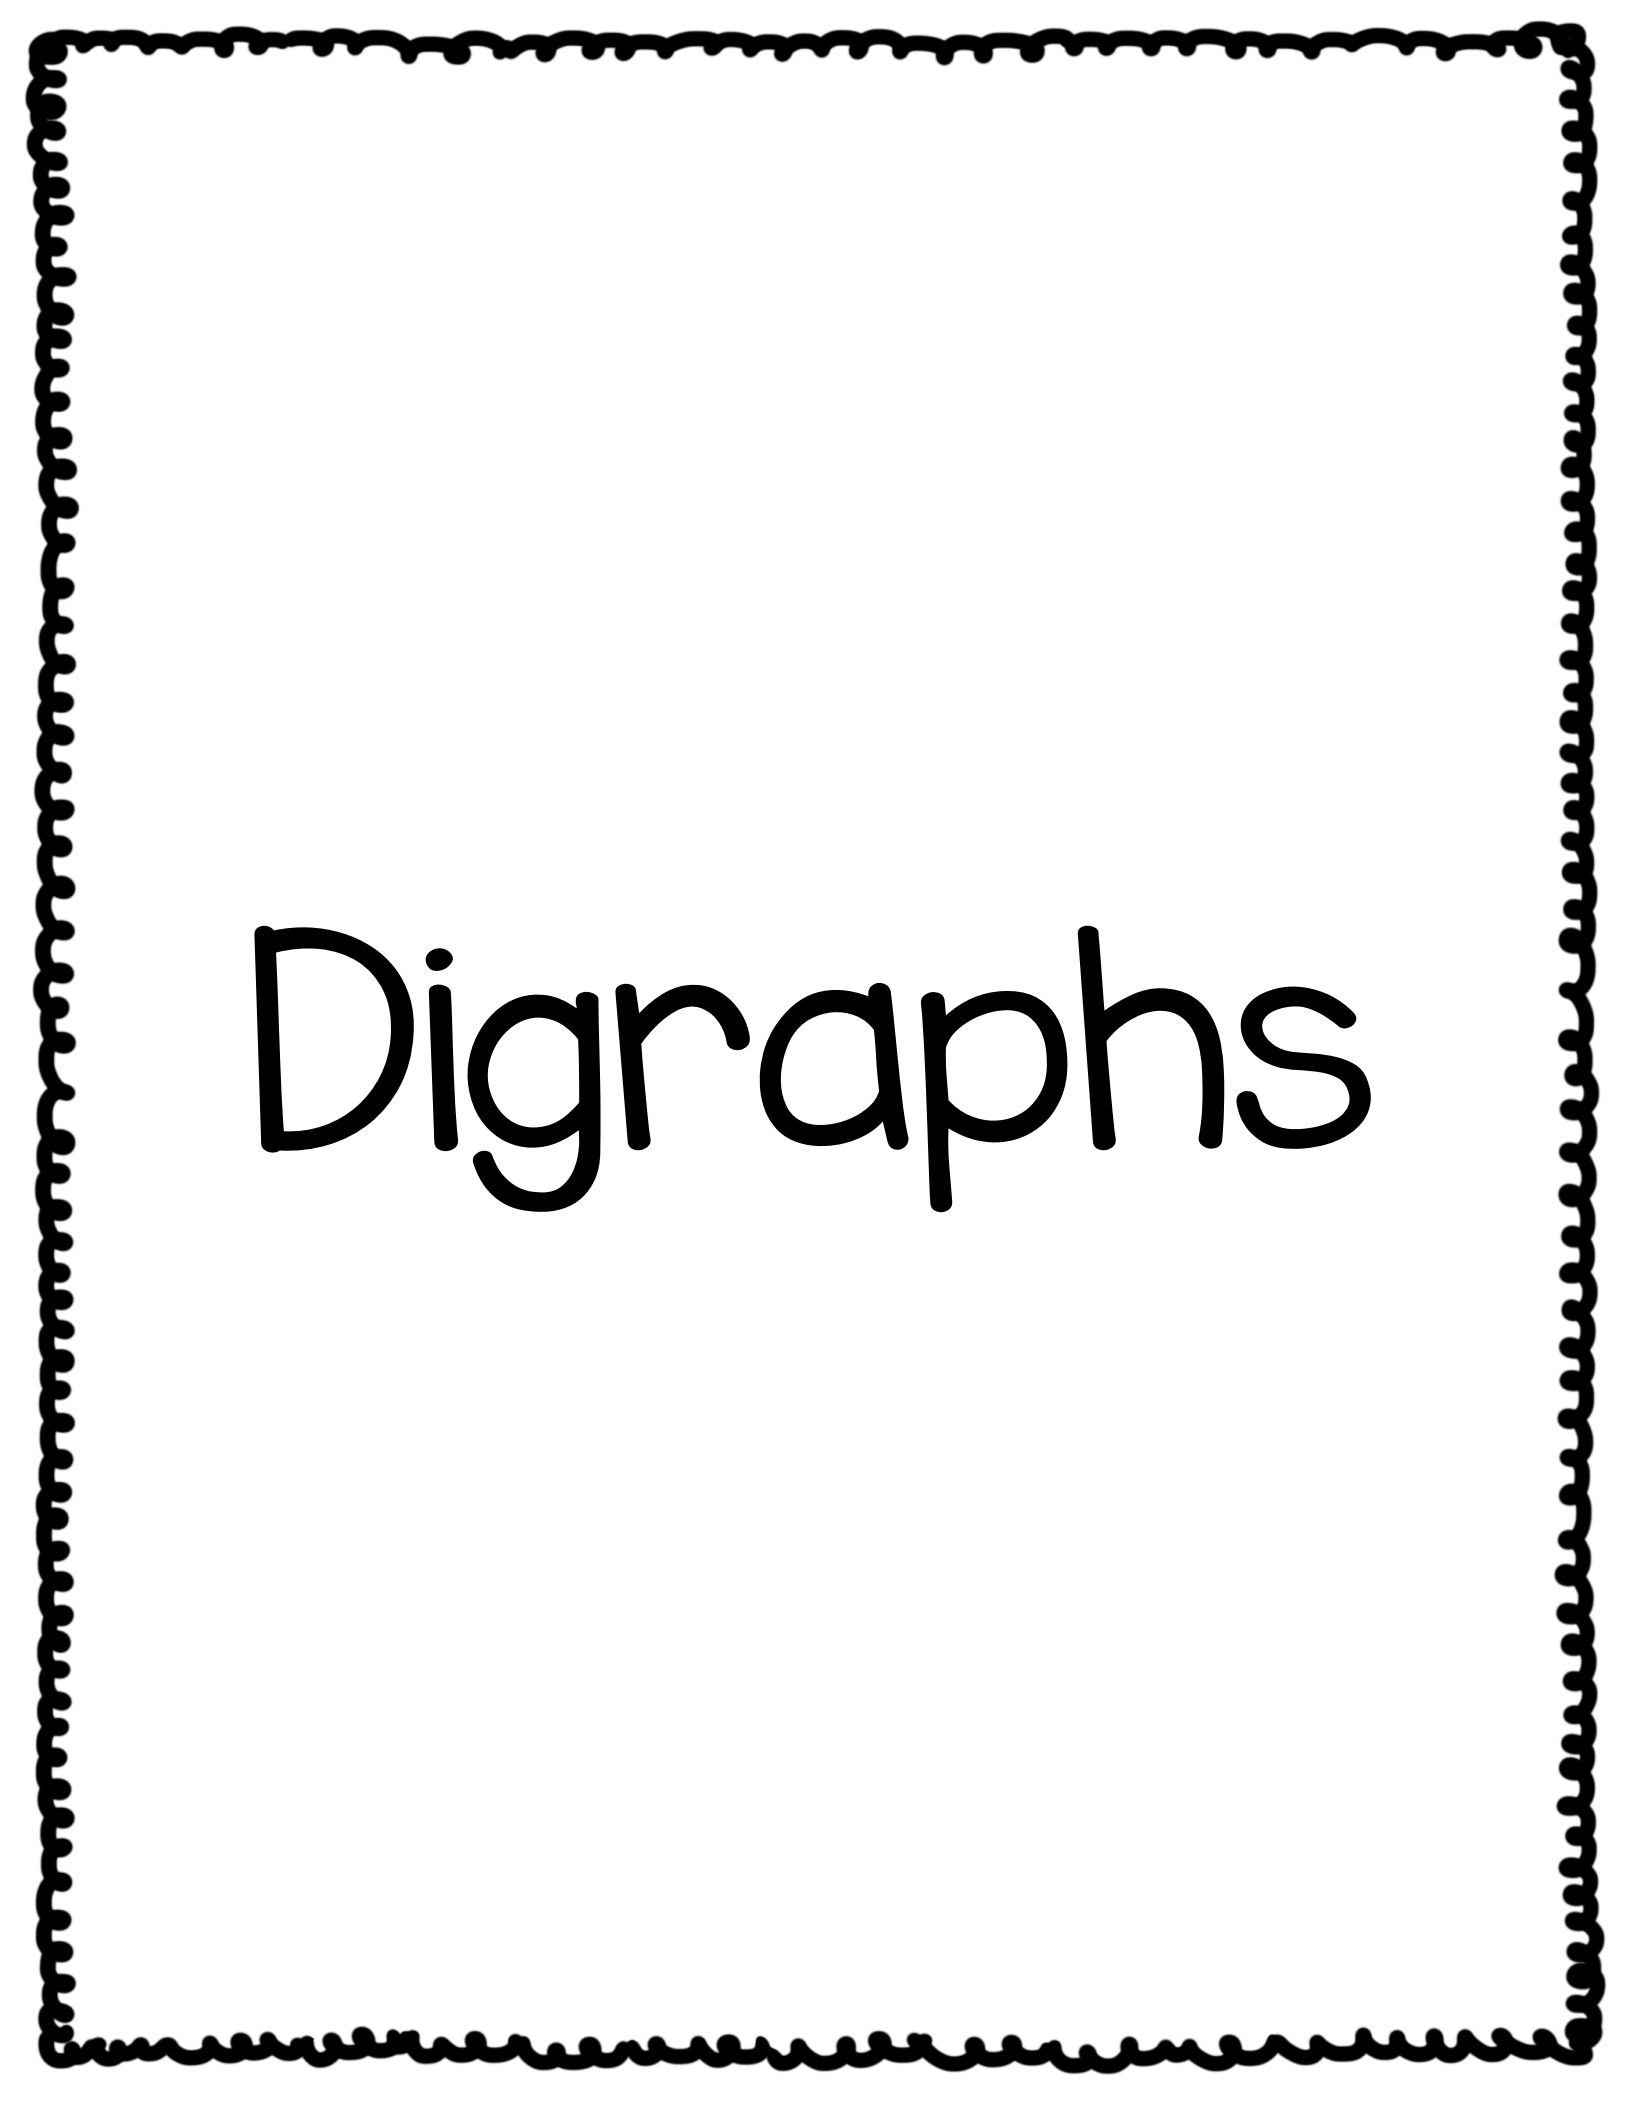

How to Use:

This resource was designed to be use alongside the Sound Mound bundle.

These worksheets will help students segment sounds and identify the most typical place these sound appear within words.

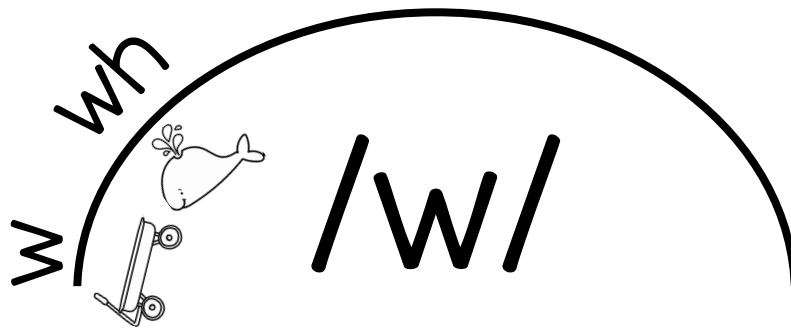

This is how the worksheets are to be completed:

1. Students will count the number of phonemes they hear in a word.
2. Students will map out the number of sounds in each box.
3. Then, students will write the sounds on the lines.
4. When writing, students will reference the sound mound on the sheet to see where the pattern is that they are learning.
